Corrections and checks

Requested changes based on the screenshots supplied by Christian.

01 Display the saved rotation name

In **Rotations & modèles**, show the name saved by the user instead of the generic « **Personnalisé** » label. For my rotation, the displayed name must be « **Syngenta** ».

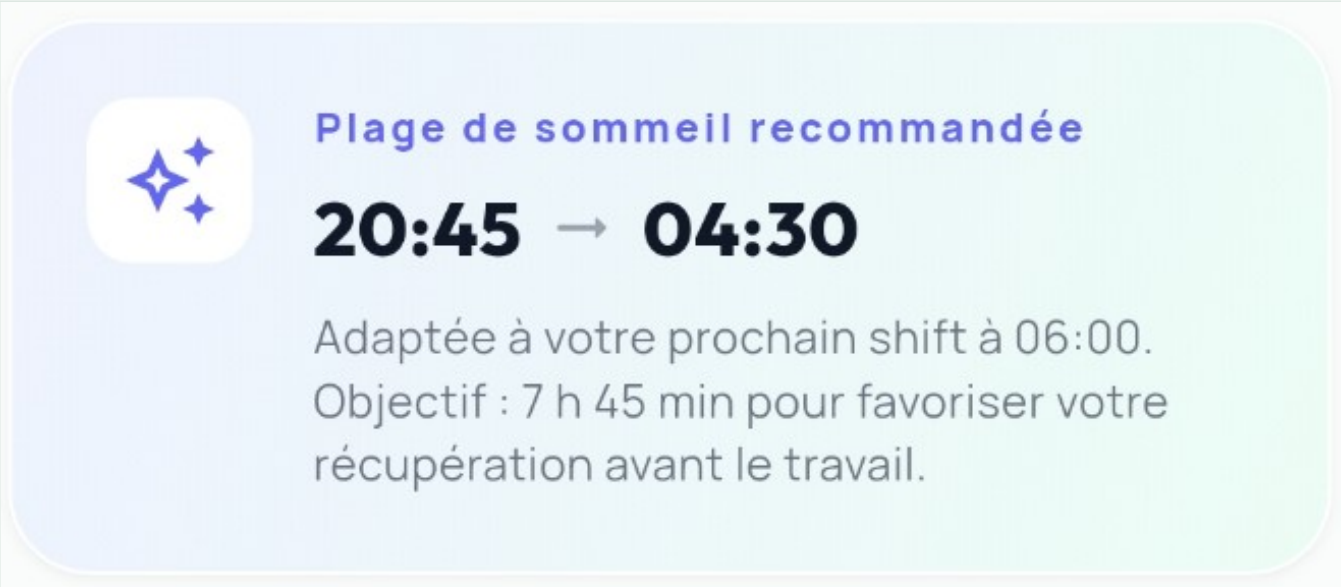

Original screenshot: the selected custom rotation still displays « Personnalisé ».

02 Use the actual next shift for the sleep window

The Sleep page shows **20:45-04:30** and says that the next shift starts at **06:00**. However, I have already finished my morning shifts: I am off today and resume night shifts tomorrow.

Please check that this recommendation uses the actual upcoming shift and the days off in the calendar. The Home and Sleep pages must use consistent data. If they describe different sleep periods, make that clear.

Original screenshot: recommended sleep window and the displayed next-shift time.

Recheck the sleep logic

03 / Bedtime calculation, time awake and transitions between shifts.

Please run a complete test of the connection between sleep recommendations, work schedules, days off and shift changes. In particular, recheck the transition from a day off into the first night shift.

Current issue
The Home screen suggests going to bed at **06:30 the next morning**. The calculation must consider the last recorded sleep and wake-up time, rather than aligning the bedtime only with the upcoming shift.

Original Home card.

Illustrative test inputs - assuming no sleep occurs in between. These wake-up times are examples described by Christian, not values transcribed from the screenshot.

Wake-up	Suggested bedtime	Implied time awake
08:00	06:30 the next day	22 h 30 min
05:00	06:00 the next day	25 hours

Please test and confirm

- Morning, afternoon and night shifts, days off, and transitions between these schedules.
- A **progressive adjustment** to nights that also checks the implied time awake and the last recorded sleep.
- Recalculation from the actual recorded sleep and wake-up time if the user does not follow the proposed schedule.
- Consistency between the Home bedtime, its countdown and the sleep window on the Sleep page.

The example of a bedtime around **01:00** was intended to illustrate a gentler adjustment before night work. It is **not a fixed rule** to apply to everyone.

A clearer, more balanced Home card

04-05 / Action text and an indicative layout proposal.

04 Make the sleep action explicit

Replace « **Dernier sommeil enregistré** » with « **Enregistrez votre dernier sommeil** ». This wording makes it clear that the user can tap here to record their last sleep.

Latest AI-generated layout example.

05 Adjust the card height

AI-generated image
This is an indicative visual reference. **It does not need to be reproduced exactly.**

Please **slightly reduce the card height and excessive empty space** compared with the current app. The blank area currently gives the impression that content is missing.

A little more green space than in the example is fine. Leave enough room for the character to remain upright, with its **natural proportions** and comfortable margins.

Scale the illustration uniformly and adjust the card height as needed. The character should not be flattened, stretched, clipped or crowded against the action band.

The goal is a balanced result: less unused space, while preserving enough room around the illustration.

Layout only: 06:30 is retained from the original screenshot. It is not an approved sleep recommendation.

Timeline texts and time zone

06-08 / Translation hand-off and items to verify.

06 Send the complete daily-timeline wording

Some event labels remain in English, including « **Main Sleep** ». Please send me the complete list of words and texts that can appear in the daily timeline, including all event types and their detail views.

Original screenshot: daily timeline.

For each text, please specify where it appears so I can translate it and return the approved French wording for you to integrate.

Include texts that are not visible in this screenshot, as well as labels shown when an event is opened.

Proposed translation
Main Sleep
Sommeil principal

07 Test and confirm time-zone synchronisation

I cannot confirm this behaviour clearly from the interface. Please test and explicitly confirm that the app synchronises correctly with the phone's current time zone, including after a time-zone change or a daylight-saving time change.

Check that the correct local times are consistently used in the work schedule, sleep recommendations and history.

08 Checks deferred to later testing
Notifications and the replacement of **ASAP** with **MTN** will be checked during my upcoming tests over time. They are **not yet confirmed**; this document does not classify them as fixed or faulty.
