IMPLEMENTATION BRIEF

Corrections for the next RYVENZA build

10 annotated screenshots translated into actionable English feedback.

Scope
Correct the existing screens and behaviour described in the supplied notes. Each issue includes the original screenshot, the requested result and focused verification checks.

CORRECTION INDEX

ID	Requested correction	Area
01	Show the custom rotation name	Work
02	Use the profile meal target	Home / Meals
03	Open the timeline at the current time	History
04	Audit bedtime and day rollover logic	Sleep / Day lifecycle
05	Localize and clarify nap logging	Sleep / Nap
06	Raise the weekly-goal sheet	Sport / Goal
07	Use a sleep-to-sleep timeline	History / Cycle
08	Include custom rotations in the selector	Work
09	Verify weekly workout progress	Sport / Progress
10	Use compact, tappable event symbols	History / Events

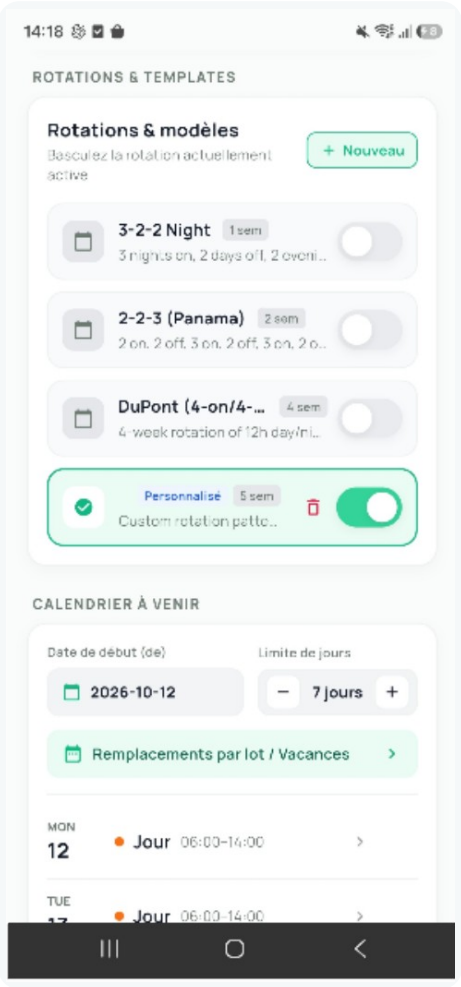

Evidence and interpretation
The screenshots establish what is visible; the French notes establish the user's requests. Suspected calculation bugs need reproduction. No bedtime formula, automatic rollover threshold or nap-quality scoring rule is invented in this brief.

Source: the 10-page annotated PDF supplied on 09 October 2026. Screenshots are cropped from those pages without changing their UI content. The numbering follows the source pages.

CORRECTION 01

Show the custom rotation name

Work / Rotations & templates

Original screenshot - source page 01

The selected 5-week card currently reads "Personnalisé".

OBSERVED / REPORTED

The active custom rotation is labelled "Personnalisé". The user wants to see the name they entered when creating this rotation.

REQUIRED RESULT

Display the saved, user-defined rotation name as the card title. "Custom" / "Personnalisé" may describe the rotation type, but must not replace its actual name. Use the same saved name in other rotation selectors (see correction 08).

VERIFICATION

- Create a rotation with a distinctive name, save it and activate it. The card displays that exact name.
- Reopen the screen and restart the app: the name remains correct.
- If a name is edited, refresh its display everywhere this rotation appears.

CORRECTION 02

Use the profile meal target

Home / Quick Add / Meals

Original screenshot - source page 02

The screenshot confirms 0/3. The target of 5 is reported in the accompanying note; it is not visible in this image.

OBSERVED / REPORTED

The Quick Add card shows 0/3. The user reports having selected 5 meals in their account settings.

REQUIRED RESULT

Read the meal target from the saved user profile. For this reported configuration, the empty-day card should display 0/5. The numerator must reflect the meals actually recorded for the active day/cycle.

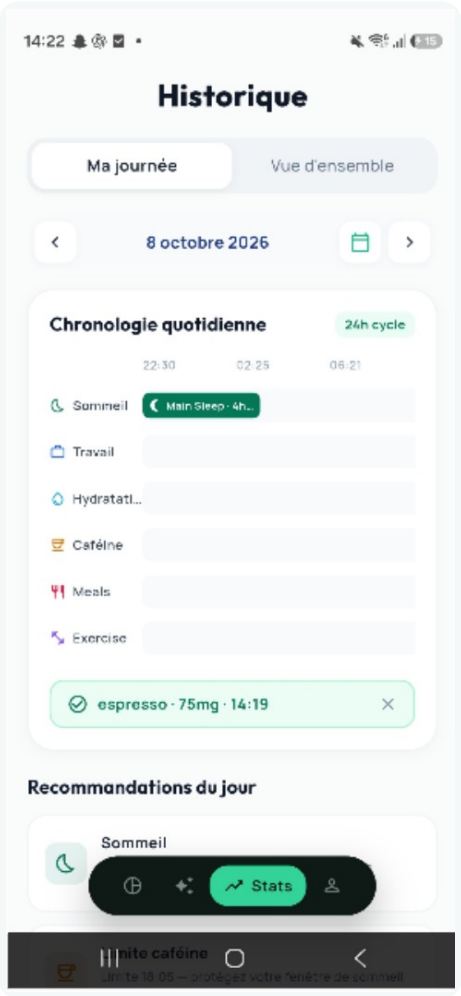

VERIFICATION

- Set the profile target to 5 meals: the empty counter reads 0/5.
- Record one meal: the counter becomes 1/5 without needing to restart the app.
- Edit or delete a meal and confirm the count updates.
- Change the target and reopen Home: the denominator follows the saved setting.

CORRECTION 03

Open the timeline at the current time

History / My day / Initial position and French labels

Original screenshot - source page 03

The screenshot shows an overnight sleep segment at the left of the timeline and an English "Meals" label.

OBSERVED / REPORTED

The user reports that opening the timeline starts at the beginning of the day. The French screen also contains the English row label "Meals".

REQUIRED RESULT

When the active day/cycle is opened, position the horizontal timeline around the current local time. The user must then be able to scroll backward and forward. In French, replace "Meals" with "Repas" and check the other timeline labels for untranslated text.

VERIFICATION

- Open My day during the afternoon: the current time is visible immediately.
- Scroll to earlier entries and back to the current time; keep navigation smooth.
- For a cycle crossing midnight, position the view using the full date and time.
- Review every timeline row in French. Historical cycles must remain browsable within their own time range.

CORRECTION 04

Audit bedtime and day rollover logic

Home / Optimal bedtime / Day lifecycle

Original screenshot - source page 04

Visible values: optimal bedtime 23:35; last sleep 4h 45m. The rest-day card describes today, while the note refers to tomorrow.

OBSERVED / REPORTED

The user reports sleep debt, roughly 4 hours of recent sleep and a rest day tomorrow, yet receives a bedtime around 23:00. The image shows 23:35 and last sleep of 4h 45m. The screenshot alone cannot establish the correct bedtime or the underlying calculation.

REQUIRED RESULT

Reproduce this case and verify which saved inputs drive the recommendation: actual sleep, sleep debt, work schedule, next-day rest status and profile settings. Check that changes trigger recalculation and that old values are not reused. Provide a clear explanation of why this case produces 23:35.

CLARIFY THE DAY-SWITCH THRESHOLD

The user describes three ways a day can end: 1. manually using "End my day"; 2. recording a new main sleep; 3. after an elapsed-time threshold. Confirm the implemented rule, the exact threshold and what starts its timer. "30 hours?" is a question, not an approved requirement. Ensure these paths do not create duplicate days or lose entries.

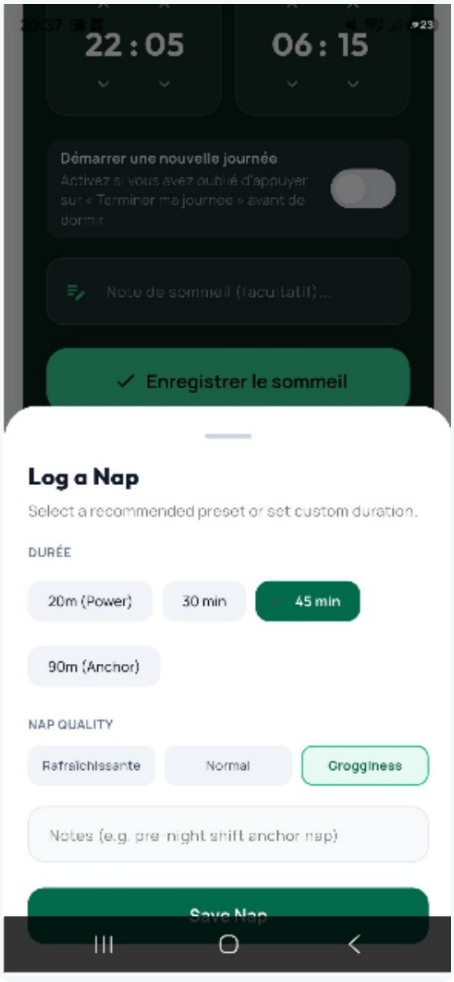

VERIFICATION

- Trace the inputs and result for this reported case, then test after changing sleep and the upcoming shift/rest day.
- Verify each rollover path and distinguish a main sleep from a nap.
- Explain how rollover and the sleep-to-sleep timeline in correction 07 work together.

CORRECTION 05

Localize and clarify nap logging

Sleep / Log a nap / Language and bottom-sheet visibility

Original screenshot - source page 05

The Android navigation bar hides part of Save Nap. French copy below is suggested.

OBSERVED / REPORTED

The app is in French, but the nap sheet mixes languages: "Log a Nap", "NAP QUALITY", "Grogginess", the helper text and "Save Nap" remain in English. The Android navigation bar overlaps the bottom action.

REQUIRED RESULT

Translate the entire sheet, including presets, hints and buttons. Keep the save button fully above the system navigation area. The quality choices must clearly describe how the user felt after the nap; clarify their intended meaning and whether they affect a score or recommendation.

VERIFICATION

- In French, no English strings remain in this sheet.
- All choices and the save action are visible and tappable.
- Explain the quality field and confirm the suggested labels below match its actual values.

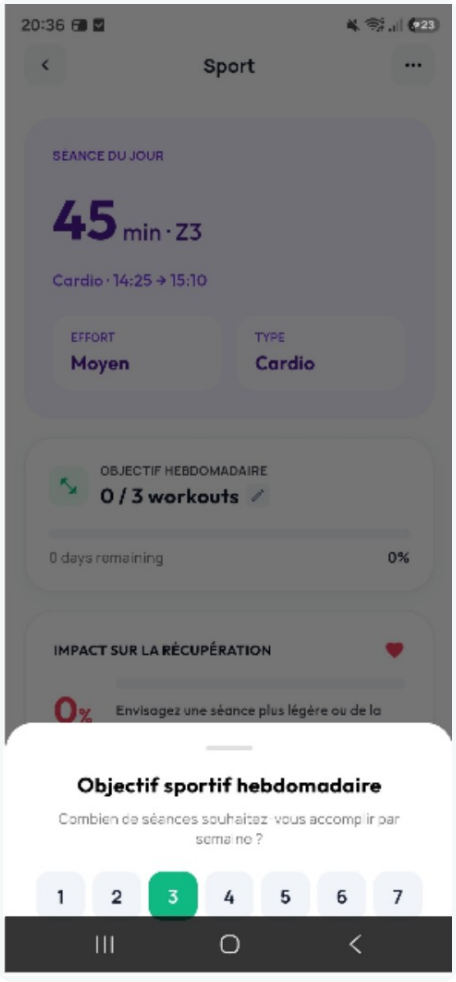

SUGGESTED FRENCH WORDING

Log a Nap / Save Nap	Enregistrer une sieste / Enregistrer la sieste
Helper text	Choisissez une durée proposée ou une durée personnalisée.
Nap quality	Comment vous sentez-vous après la sieste ?
Refreshing / Normal / Grogginess	Reposé(e) / Comme avant / Encore somnolent(e)
Notes placeholder	Note facultative

CORRECTION 06

Raise the weekly-goal sheet

Sport / Weekly workout goal / Bottom safe area

Original screenshot - source page 06

The choices 1 to 7 are placed directly against the system navigation area. Apply the same layout check to the nap sheet in correction 05.

OBSERVED / REPORTED

The weekly workout-goal sheet sits too low. The Android navigation bar covers the bottom of the goal choices.

REQUIRED RESULT

Adjust the sheet layout to respect the device bottom inset. The full goal selector and any confirmation controls must remain visible and tappable above system navigation. Allow scrolling when the available height is limited.

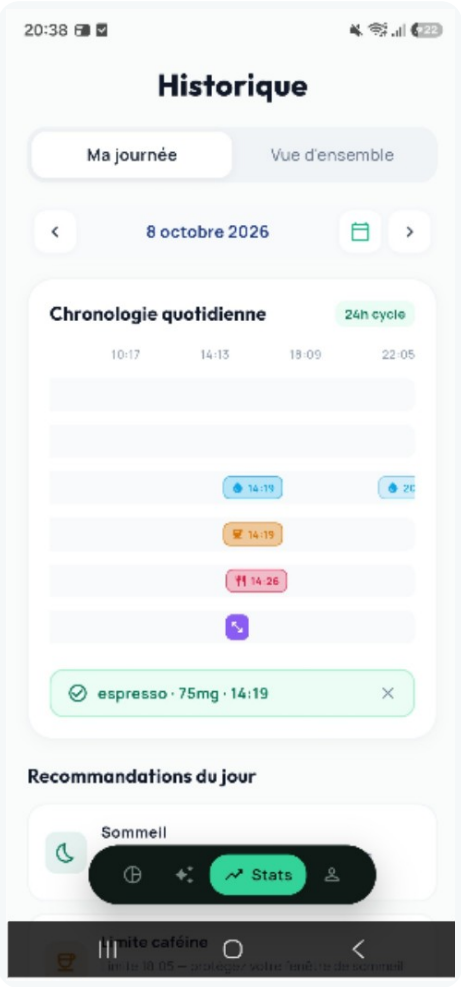

VERIFICATION

- Open the sheet with Android three-button navigation and with gesture navigation.
- Select the first and last goal options without overlap or obstructed hit areas.
- Confirm or dismiss the sheet normally, and verify the saved target is retained.
- Also verify the layout with larger text settings and a smaller screen.

CORRECTION 07

Use a sleep-to-sleep timeline

History / My day / Actual cycle boundaries

Original screenshot - source page 07

Another supplied capture (page 10) shows "25h cycle". Verify how boundaries are currently calculated; the requested rule is actual main bedtime to main bedtime.

OBSERVED / REPORTED

This capture shows a "24h cycle" badge. The user explicitly asks for a timeline from the previous main bedtime to the next main bedtime, including the first sleep and the waking period that follows.

REQUIRED RESULT

Base the displayed interval on the actual main-sleep boundaries rather than forcing a 24-hour range. The duration can be shorter or longer than 24 hours. Use the same interval for the axis, events and displayed cycle duration. When the next main bedtime is not yet recorded, show the cycle as ongoing.

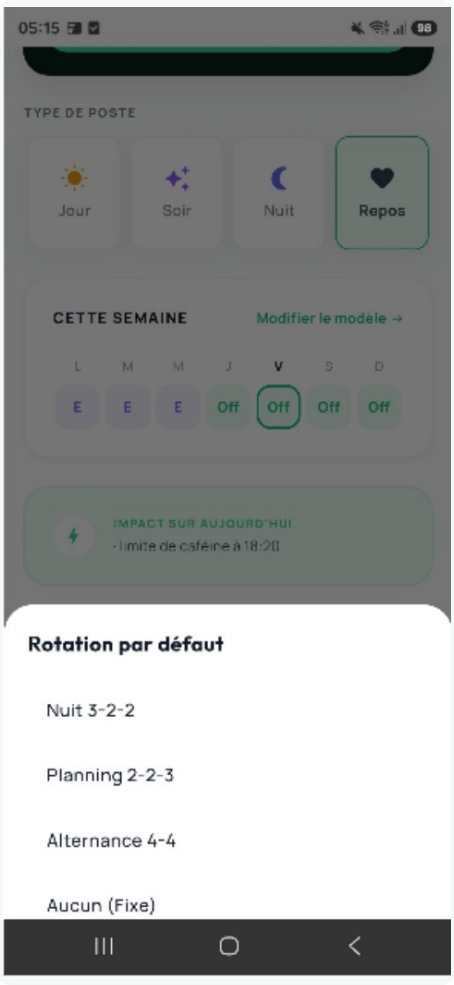

VERIFICATION

- Example: main bedtime on 8 Oct at 22:30, next main bedtime on 9 Oct at 21:00. Display a 22h 30m interval.
- Keep sleep, work, hydration, caffeine, meals and exercise on the correct side of midnight.
- A nap stays inside the current cycle and does not define its end.
- Check edited sleep times, long shifts and cycles exceeding 24 hours.

CORRECTION 08

Include custom rotations in the selector

Work / Default rotation

Original screenshot - source page 08

The visible list includes preset rotations and "Aucun (Fixe)"; no named custom rotation is visible in this capture.

OBSERVED / REPORTED

The "Rotation par défaut" selector shows preset choices. The user wants the rotation they created to appear here under its own name.

REQUIRED RESULT

Include the user's saved custom rotations in this selector, alongside the existing presets. Display each custom rotation using its saved name, and apply the selected rotation to the work schedule. Keep the displayed name consistent with correction 01.

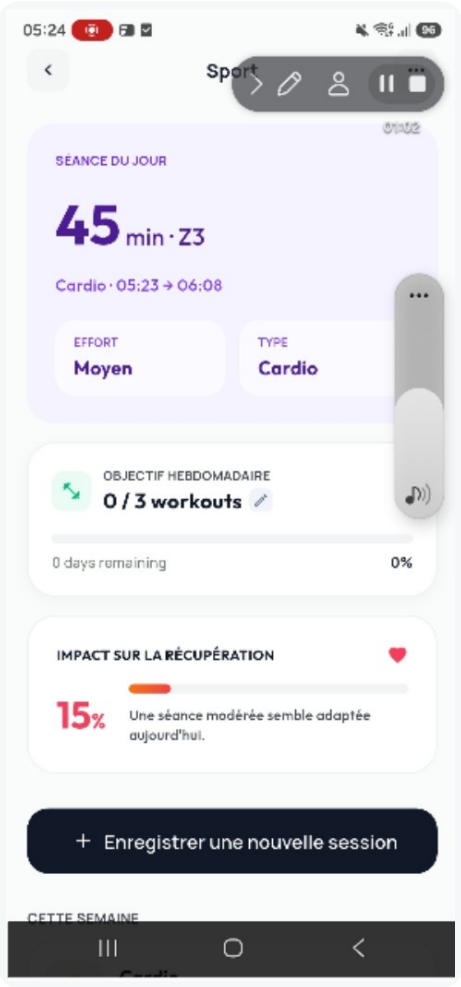

VERIFICATION

- Create a named custom rotation and reopen the default-rotation selector. It appears as an available choice.
- Select it and verify the resulting shifts match the saved pattern.
- Reopen the screen or restart the app: the selection and name remain correct.
- Test multiple custom rotations so each selection applies the correct pattern.

CORRECTION 09

Verify weekly workout progress

Sport / Weekly objective / Count and refresh

Original screenshot - source page 09

This is a reported suspected bug, supported by the visible session and zero counter. "Workouts" and "days remaining" also need French labels on this French screen.

OBSERVED / REPORTED

The user suspects the weekly workout count never updates. A 45-minute session is visible while the weekly goal still reads 0/3 workouts and 0%. The card also shows "0 days remaining". These images do not confirm the cause.

REQUIRED RESULT

Reproduce the issue with a saved qualifying session. Check session persistence, the week boundaries, any completion rule and refresh after save/edit/delete. Once a qualifying session is counted, update both the total and percentage. Verify the remaining-days value separately.

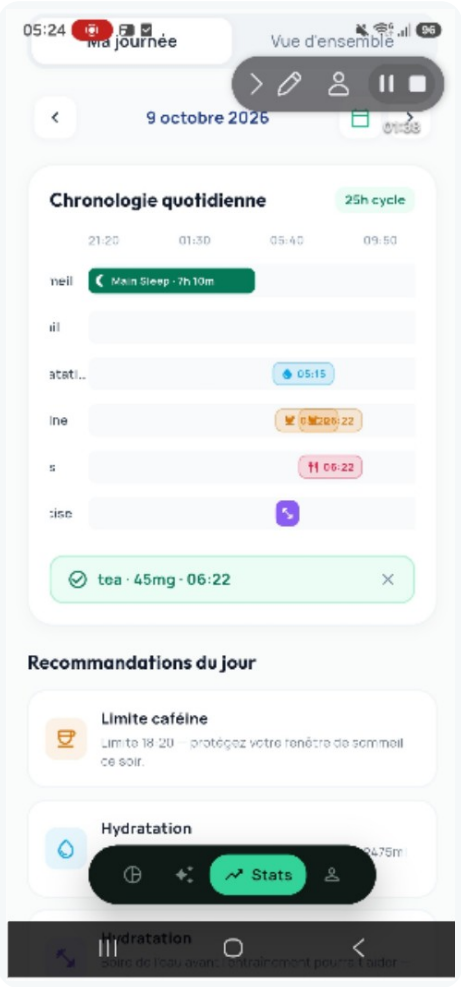

VERIFICATION

- With a target of 3, save one qualifying session: show 1/3 and a corresponding percentage.
- Save another qualifying session and verify the count updates; edit/delete entries and check recalculation.
- Reopen Sport and restart the app: progress remains consistent.
- Test the week boundary using the user's timezone and the intended week-start rule.

CORRECTION 10

Use compact, tappable event symbols

History / My day / Timeline density and entry details

Original screenshot - source page 10

The screenshot contains wide hydration, caffeine and meal chips with embedded times. The existing exercise icon shows the compact style the user is asking for.

OBSERVED / REPORTED

The user finds the event blocks too large because they display the time directly inside the timeline. Their request is to show a small symbol and reveal the details when it is tapped.

REQUIRED RESULT

Use compact symbols for recorded events instead of wide text-labelled blocks. Keep each symbol at its actual time on the axis. On tap, show the entry details, including time and the relevant amount, type or duration. Preserve a comfortable tap area even when the visible icon is small.

VERIFICATION

- Log hydration, caffeine, a meal and exercise: display compact, identifiable symbols.
- Tap each symbol and verify that the correct entry and its details open.
- Test several events close together so that each remains selectable.
- Confirm timeline scrolling and the initial current-time position from correction 03 still work.
