09 OCTOBER 2026 / ADDITIONAL FEEDBACK

Corrections and clearer flows

English brief for the developer, with original screenshots and expected behaviour.

Please review this document alongside the two previous correction PDFs. It adds the issues below and proposes clearer wording for the daily percentages and a simpler nap entry flow.

ITEMS TO REVIEW

01	**Caffeine entry** Save the custom drink name correctly.	02
02	**Sleep calculations** Review the late bedtime, wake-up and shift context.	03
03	**Bedtime consistency** Align the home card and sleep screen.	04
04	**Daily percentages** Explain the scale on tap, in French and English.	05-06
05	**Recommendation translation** Translate the action count into French.	07
06	**Sleep deletion** Allow one sleep record to be deleted.	04
07	**Statistics entry screen** Open My Day first.	08
08	**Nap logging** Add start/end times, deletion and a clearer entry point.	09

IMPLEMENTATION NOTE

Observed issues and requested changes come from the supplied notes. Proposed UX and percentage wording are explicitly identified; the screenshots do not establish the underlying calculation formulas.

01 / CAFFEINE ENTRY

Custom drink name is not saved

A custom name must remain attached to the edited caffeine record.

Edit form: the name still shows “autre” (Other).

REPORTED ISSUE

I entered **Monster** as the drink name, but the change was not saved. When the entry is reopened, the name still shows **“autre” / “Other”**.

EXPECTED BEHAVIOUR

Save the exact custom name entered by the user. Reopening the entry must show **Monster**, with its caffeine amount, date and time preserved.

REPRODUCTION CHECK

Edit the affected entry, replace “Other” with “Monster”, tap **Save**, then reopen it. Also check the displayed name after navigating away and reopening the app.

DEVELOPER CHECK

Check whether the edited name is persisted and returned correctly, and whether the form or list is displaying a default label instead of the saved value.

Pass condition: “Monster” appears both in the saved entry and in the edit form after reopening it.

Source: annotated PDF, page 1.

02 / SLEEP CALCULATIONS

Review the proposed bedtime

The displayed bedtime is difficult to reconcile with the reported wake-up and shift context.

Home card: recommended bedtime 23:50.

Recommendations: 23:50 and a sleep-debt message.

REPORTED CONTEXT

The user reports waking at **04:00**, having approximately **1 h 15 min** of sleep debt and starting work at **06:00 in two days**. A suggested bedtime of **23:50** therefore needs to be checked and explained.

WHAT THE SCREENSHOTS SHOW

The recommendation screenshot mentions **1 h 40 min** of debt, rather than the 1 h 15 min stated in the note. Verify the actual record and calculation; do not assume that either value is the authoritative result.

REQUESTED REVIEW

Check which wake-up date/time, upcoming shift and sleep records are used. If 04:00 is the required wake-up the next morning, 23:50 leaves only **4 h 10 min** between bedtime and wake-up. Explain how the result is produced and correct the calculation if needed.

Expected: the recommendation uses the correct day and work context, and the displayed sleep debt is consistent across the app.

Source: annotated PDF, pages 2-3.

03 + 06 / SLEEP CONSISTENCY AND DELETION

One bedtime, editable sleep history

Explain or resolve the conflicting times, and allow accidental entries to be removed individually.

Home: 00:00.

Sleep screen: 22:30 → 06:15; debt shown as 0.

03 / ALIGN BEDTIME INFORMATION

The home card displays **00:00**, while the sleep screen displays **22:30 → 06:15**. If these represent the same recommendation, they must agree and refresh together. If they are different concepts, explain the distinction and use clear labels so users understand each time.

06 / DELETE ONE SLEEP RECORD

Add a delete action for **one selected main sleep record**. Users need to correct an accidental entry without deleting the full history, a whole day or unrelated records. Confirm which entry is being removed, then update the relevant totals, debt, scores and recommendations.

CHECKS TO PERFORM

The screenshot lists two sleep records for Friday 9. Check whether these are intentional or accidental entries; the image alone does not establish that they are duplicates. After deleting one selected record, verify that the other remains and all affected displays refresh.

04 / DAILY PERCENTAGE INDICATORS

Make each percentage understandable

Users should know what the value measures and whether a higher value is more favourable.

Visible indicators: Sleep, Hydration, Caffeine and Recovery.

REPORTED ISSUE

The percentage rings are not clear. It is difficult to tell what **0%** and **100%** mean, or in which direction the indicator should move.

REQUESTED INTERACTION

Tapping each ring should open a short explanation, for example a small bottom sheet. Include the indicator name, what it measures, the meaning of 0% and 100%, and the favourable direction.

CALCULATION MUST MATCH THE TEXT

The supplied PDF does not document the formulas. Confirm the actual meaning of all four indicators before using the proposed copy. In particular, check whether Caffeine is an exposure/remaining-caffeine percentage or a favourable compatibility score.

COPY PROPOSAL ON THE NEXT PAGE

The draft uses **higher = more favourable** for all four indicators. Use it only where this matches the calculation. If a metric runs in the opposite direction, provide matching endpoints and direction instead of applying the draft unchanged.

Pass condition: every ring opens a concise explanation in the selected language, and that explanation accurately describes the computed value.

Source: annotated PDF, page 3. Proposed FR/EN wording follows on page 6.

04 / PROPOSED INTERFACE COPY

Percentage explanations: FR / EN

Draft wording to validate against the actual calculations before implementation.

Sleep / Sommeil

FRENCH

Indique dans quelle mesure le sommeil enregistré correspond à votre objectif. 0 % : objectif non atteint. 100 % : objectif atteint. Plus le pourcentage est élevé, plus l’indicateur est favorable.

ENGLISH

Shows how closely your logged sleep matches your target. 0%: target not met. 100%: target met. A higher percentage is more favourable.

Hydration / Hydratation

FRENCH

Indique votre progression vers l’objectif d’hydratation de la journée. 0 % : aucune eau enregistrée. 100 % : objectif atteint. Le pourcentage augmente à mesure que vous vous rapprochez de l’objectif.

ENGLISH

Shows your progress towards today’s hydration target. 0%: no water logged. 100%: target reached. The percentage rises as you get closer to the target.

Caffeine / Caféine

FRENCH

Indique à quel point vos prises de caféine sont compatibles avec votre sommeil prévu. 0 % : compatibilité faible. 100 % : compatibilité élevée. Un pourcentage plus élevé est plus favorable.

ENGLISH

Shows how compatible your caffeine intake is with your planned sleep. 0%: low compatibility. 100%: high compatibility. A higher percentage is more favourable.

Recovery / Récupération

FRENCH

Représente votre récupération estimée à partir des données utilisées par l’application. 0 % : récupération estimée très faible. 100 % : récupération estimée élevée. Un pourcentage plus élevé est plus favorable.

ENGLISH

Represents your estimated recovery based on the data used by the app. 0%: very low estimated recovery. 100%: high estimated recovery. A higher percentage is more favourable.

Validation required: the Sleep draft assumes a target-based score; the Caffeine draft assumes a compatibility score. Confirm the measured quantity and endpoint definitions for every indicator. Do not present missing data as a measured 0%.

Source: wording proposed in response to the request on annotated PDF, page 3.

05 / RECOMMENDATION TRANSLATION

Translate the action-count banner

The French interface currently contains an English phrase.

Current mixed-language banner: “9 actions for today”.

REPORTED ISSUE

The Recommendations page is in French, but the green summary banner says **“9 actions for today”**.

FRENCH REPLACEMENT

9 actions pour aujourd’hui

ENGLISH VERSION

9 actions for today

DYNAMIC COUNT AND SINGULAR

Keep the count dynamic rather than hard-coding 9.

French:
1 action pour aujourd’hui
{count} actions pour aujourd’hui

English:
1 action for today
{count} actions for today

PASS CONDITION

The banner follows the selected app language and shows the actual number of actions with the correct singular or plural.

Source: annotated PDF, page 4.

07 / STATISTICS NAVIGATION

Open My Day first

The Statistics entry point should immediately show the daily view.

Current entry screen: “Vue d’ensemble” (Overview) is selected.

REQUESTED CHANGE

When the user taps **Stats** in the main navigation, open **Ma journée / My Day** first, rather than **Vue d’ensemble / Overview**.

EXPECTED FLOW

Main navigation → Stats → My Day.

Overview remains available as the second view when the user explicitly selects it.

RE-ENTRY BEHAVIOUR

Each entry into Stats from the main navigation should open My Day, even if Overview was the last view used. Within Stats, the user can still switch between the two views.

PASS CONDITION

From Home or another main section, tap Stats and verify that My Day is selected and its daily content is shown immediately.

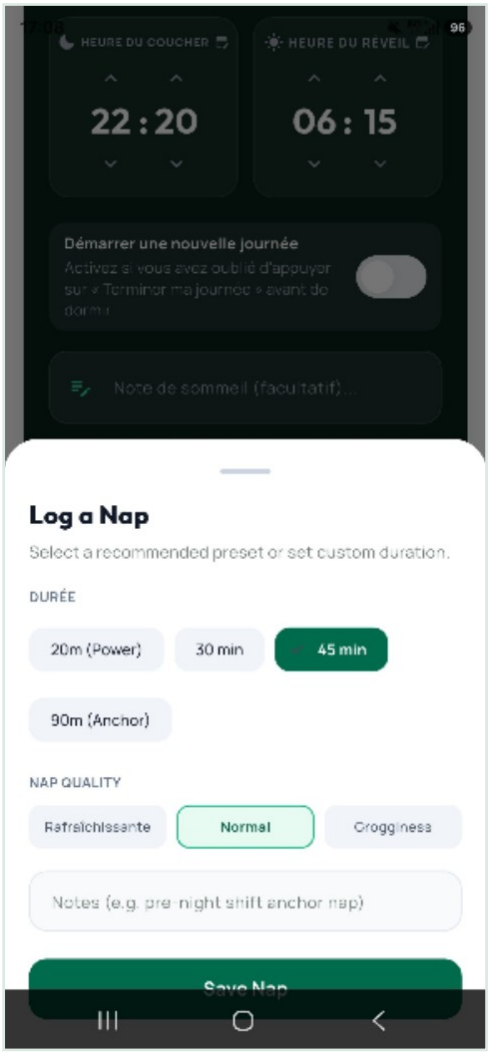

Scope: this changes the initial view of the Statistics section. The request does not call for a redesign of the Recommendations page.

Source: annotated PDF, page 6.

08 / NAP LOGGING

A clearer, complete nap entry

Record duration and exact times, with an accessible way to edit or delete the nap.

Current nap form: duration presets, but no visible start/end inputs.

REQUESTED FIELDS

Show the **nap duration**, **start time** and **end time**. Users must be able to record when the nap actually happened, rather than only selecting a duration.

KEEP THE TIMES CONSISTENT

Changing the start/end times should update the duration. When a duration preset is selected, use the chosen start time to calculate the end time. Example: **17:00 → 17:45 = 45 min**. Keep the date clear for past entries.

EDIT AND DELETE

Allow users to reopen a saved nap, correct it and delete that nap individually. Refresh affected totals and recommendations after saving or deleting.

SUGGESTED UX

Use a small, dedicated **Sieste / Nap** quick-entry action near the sleep logging controls. Keep the nap entry separate from the main bedtime/wake-up form and display duration, start and end clearly in the saved nap row.

DEVELOPER FEEDBACK REQUESTED

Please advise on the simplest placement for a more visible nap entry. The field and deletion changes are requested corrections; the separate quick-entry placement is a proposal to discuss.

Source: annotated PDF, page 7. Separate nap access is a UX proposal for discussion.
