History: daily timeline

Horizontal timeline in a portrait mobile screen - selected design and interaction rules

Reference screenshot: a nap is selected.

01 Day boundaries: main sleep start to start

A day runs from the **start of one main sleep to the start of the next**. Include the opening sleep and the waking period after it; the next main sleep belongs to the next day. Use this initial sleep to guide the day and next sleep recommendation. No fixed 24-hour limit: **26 Sep 07:00 to 27 Sep 08:00 = 25 hours**. Select by start date, show the full range, and open a month picker from the calendar icon.

02 Timeline and naps

Swipe horizontally with fixed category labels; mark midnight and the new date. Keep six tracks: Sleep, Work, Hydration, Caffeine, Meals and Exercise. Scale slim bars and place event icons by actual timestamps. Show **naps within Sleep** using a distinct crescent-with-zZ icon and a short bar. Allow one or several naps when logged; **naps never start a new day**.

03 Tap an event: inline details

Highlight the selected event and replace the hint with **one small rectangle inside the timeline card**, above Recommendations. Show type, amount or duration, and date/time: **Nap · 30 min**, 26 Sep · 17:30-18:00. Selecting another event updates this rectangle; closing it restores the hint. Keep other event details hidden. No popup or page change.

04 Recommendations

Use four recommendation types below the timeline: **Exercise, Nap, Caffeine cutoff and Sleep**. Show pink icons (zZ for naps) and suggested times from the existing adaptive logic. A tap opens a bottom sheet with the time and explanation. Account for work, activities, main sleep and logged naps; show nap guidance when recommended.

05 Header, tabs and style

Page title: **History** (Historique in French). Tabs: **My day on the left, selected**; **Overview on the right**. Keep white cards, dark text, darker navy secondary text, slightly darker emerald icons and bars, pink recommendation icons, and the existing bottom navigation.

Implementation note: Times are illustrative. For an ongoing day, label the recommended next main sleep start as an estimated endpoint; use the actual start once recorded.
